### SITUATION REPORT

May/June Rain Event

### FINAL REPORT

June 11, 2001

With little or no precipitation falling in the Missouri River watershed, yesterday, many local creeks and tributaries of the Missouri have stabilized and are now receding. However, standing water from flooding continues to be a problem throughout the State of Missouri. The Missouri River and its tributaries in West Central Missouri have been of concern since heavy rains and localized thunderstorms began. The Missouri River has crested all the way to the confluence with the Mississippi River. There wasn't any flooding reported in the St. Louis Metro Area.

#### **County Reports:** No Change

**Missouri River:** Is expected to be below flood stage at all reporting stations by Wednesday, June 13, 2001. Bagnall Dam is releasing pass through waters from Truman Lake for the next four days, that may cause minor agricultural flooding on the Osage.

**Mississippi River:** Is expected to be below flood stage at all reporting stations by Wednesday, June 13, 2001.

**Weather Forecast (National Weather Service):** The weather for the next few days will be clear and sunny with above seasonable norms (in the 90's for highs). No rain in the forecast for the next four days. The forecast will not have an adverse impact on river levels.
